

# Computer Architecture

## CS-211

Spring 2017  
Recitation #6

# Registers Overview

- Named storage locations inside the CPU, optimized for speed

## 32-bit General-Purpose Registers

EAX
EBX
ECX
EDX

EBP
ESP
ESI
EDI

## 16-bit Segment Registers

EFLAGS
EIP

CS	ES
SS	FS
DS	GS

# ASCII

- Computers can only understand numbers
- an ASCII code is the numerical representation of a character such as 'a' or '@' or an action of some sort.
- <http://www.asciitable.com>

# Data Registers

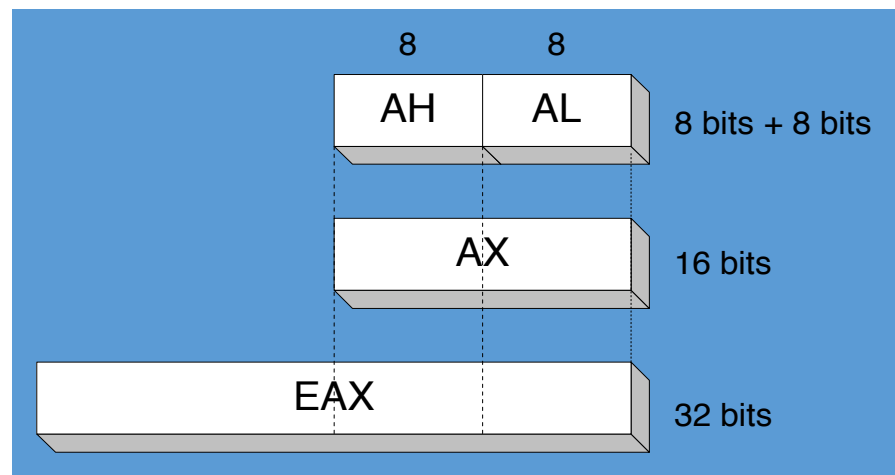

- AX is the primary accumulator
  - Used in most arithmetic instruction
- BX is the base register
  - Could be used in indexed addressing
- CX is the count register
  - Store the loop count in iterative operations
- DX is the data register
  - Used in input / output operations

# Data Registers

Can use 8-bit, 16-bit, or 32-bit name

32-bit	16-bit	8-bit (high)	8-bit (low)
EAX	AX	AH	AL
EBX	BX	BH	BL
ECX	CX	CH	CL
EDX	DX	DH	DL

# Pointer Registers

- ESP is stack pointer
  - It refers to be current position of data or address within the program stack
  - Changed by push, pop instructions
- EBP is frame pointer
  - Referencing the parameter variables passed to a subroutine
- EIP is instruction pointer
  - It stores the offset address of the next instruction to be executed

# Stack Operation

- By convention, %esp is used to maintain a stack in memory
  - %esp contains the address of top of stack
- Instructions to push (pop) content onto (off of) the stack
  - pushl %eax
    - $\text{esp} = \text{esp} - 4$  |  $\text{Memory}[\text{esp}] = \text{eax}$
  - popl %ebx
    - $\text{ebx} = \text{Memory}[\text{esp}]$  |  $\text{esp} = \text{esp} + 4$

# Address computation

<code>%edx</code>	<code>0xf000</code>
<code>%ecx</code>	<code>0x100</code>

Expression	Computation	Address
<code>0x8(%edx)</code>	<code>0xf000 + 0x8</code>	<code>0xf008</code>
<code>(%edx,%ecx)</code>	<code>0xf000 + 0x100</code>	<code>0xf100</code>
<code>(%edx,%ecx,4)</code>	<code>0xf000 + 4*0x100</code>	<code>0xf400</code>
<code>0x80(,%edx,2)</code>	<code>2*0xf000 + 0x80</code>	<code>0x1e080</code>

# Control Registers

- Overflow flag (OF)
  - Indicates the overflow of a high-order bit
- Carry flag (CF)
  - Contains the carry of 0 or 1 from high-order bit after arithmetic operation
  - Stores the last bit of a shift or rotate operation
- Sign flag (SF)
  - Shows the sign of the result of an arithmetic operation
  - Positive -> 0, Negative -> 1
- Zero Flag (ZF)

# `gdb`

- A good tutorial for debugging assembly with `gdb`
  - [https://www.csee.umbc.edu/~cpatel2/links/310/nasm/gdb\\_help.shtml](https://www.csee.umbc.edu/~cpatel2/links/310/nasm/gdb_help.shtml)
- `gcc -m32 fib.c -g -o fib`
- `gdb fib`
- `r (arg1) (arg2) ..`
- `c (continue)`
- `layout asm`
- `b * address`
- `p /x $eax`
- `ni`
- `si`
- `info r`
- `x addr -> (x / x) address =` shows the hex / `(x/d) address =` shows the decimal
